
FLOATING POINT NUMBERS

IEEE floating point standard

Bernhard Kainz (with thanks to **A. Gopalan, N. Dulay** and **E. Edwards**)

b.kainz@imperial.ac.uk

IEEE floating point standard

- IEEE: **institute of electrical and electronic engineers (USA)**
- **Comprehensive standard** for binary floating point arithmetic
- Widely adopted ➔ **predictable results** independent of architecture
- Standard defines:
  - **Format** of binary floating point numbers, i.e. how the fields are stored in memory
  - **Semantics** of arithmetic operations
  - Rules for **error conditions**

Single precision format (32-bit)

Sign S	Exponent E	Significand F
1 bit	8 bits	23 bits

- Coefficient is called the **significand** in the IEEE standard
- Value represented is $\pm\mathbf{1.}\boldsymbol{F} \times \mathbf{2}^{\boldsymbol{E}-\mathbf{127}}$
- The **normal bit** (the 1.) is omitted from the significand field ➔ a **hidden bit**
- Single precision yields **24 bits** (approx. **7 decimal digits** of precision)
- **Normalised ranges** in decimal are approximately:

$$\mathbf{-10^{38}\ to\ -10^{-38}, \quad 0, \quad 10^{38}\ to\ 10^{-38}}$$

Exponent field

- In the IEEE standard, exponents are stored as **excess values**, not as 2's complement

- Example: **In 8-bit excess-127**

-127	would be held as	**0000 0000**
…		…
0		**0111 1111**
1		**1000 0000**
…		…
128		**1111 1111**

- Allows non-negative floating point numbers to be compared using simple integer comparisons

Double precision format (64-bit)

Sign S	Exponent E	Significand F
1 bit	11 bits	52 bits

- Value represented is $\pm \mathbf{1}.F \times \mathbf{2}^{E-\mathbf{1023}}$
- Double precision yields **53 bits** (approx. **16 decimal digits** of precision)
- **Normalised ranges** in decimal are approximately:

$$-\mathbf{10^{308}} \textbf{ to } -\mathbf{10^{-308}}, \quad \mathbf{0}, \quad \mathbf{10^{308}} \textbf{ to } \mathbf{10^{-308}}$$

- Single precision generally reserved for when memory is scarce or for debugging numerical calculations since rounding errors show up more quickly

Example: conversion **to** IEEE format

What is 42.6875 in IEEE single precision format?

1. Convert to **binary number**: $42.6875 = 101010\,.\,1011$
2. **Normalise**: $1.0101\,0101\,1 \times 2^5$
3. **Significand field** is thus:
   $0101\,0101\,1000\,0000\,0000\,000$
4. **Exponent field** is $(5 + 127 = 132)$: $1000\,0100$

Sign S	Exponent E	Significand F
0	1000 0100	0101 0101 1000 0000 0000 000

Hex: 422A C000

Example: conversion **from** IEEE format

What is the IEEE single precision value represented by **BEC0 0000** in decimal?

Sign S	Exponent E	Significand F
1	0111 1101	1000 0000 0000 0000 0000 000

1. **Exponent field:** $0111\ 1101 = 125$
2. True **binary exponent:** $125 - 127 = -2$
3. **Significand field + hidden bit:**
   $1.1000\ 0000\ 0000\ 0000\ 0000\ 000$
4. So **unsigned value** is $1.1 \times 2^{-2} = 0.011$ (binary)
   $= 0.25 + 0.125 = 0.375$ (decimal)
5. Adding **sign bit** gives finally $\mathbf{-0.375}$

Example: addition

Carry out the addition $\mathbf{42.6875 + 0.375}$ in IEEE single precision arithmetic

Number	Sign	Exponent	Significand
42.6875	0	1000 0100	0101 0101 1000 0000 0000 000
0.375	0	0111 1101	1000 0000 0000 0000 0000 000

- To add these numbers, exponents must be the same ➔ make the smaller exponent equal to the larger by shifting significand accordingly
- **Note:** must restore **hidden bit** when carrying out floating point operations

Example: addition (cont.)

- **Significand** of larger no.: $1.0101\ 0101\ 1000\ 0000\ 0000\ 000$
- **Significand** of smaller no.: $1.1000\ 0000\ 0000\ 0000\ 0000\ 000$

- Exponents differ by ($1000\ 0100\ - 0111\ 1101 = 7$) so shift binary point of smaller no. 7 places to the left:

- **Significand** of smaller no.: $0.0000\ 0011\ 0000\ 0000\ 0000\ 000$
- **Significand** of larger no.: $1.0101\ 0101\ 1000\ 0000\ 0000\ 000$
- **Significand** of **sum**: $1.0101\ 1000\ 1000\ 0000\ 0000\ 000$

- So **sum** is $1.0101\ 1000\ 1 \times 2^5 = 10\ 1011.0001 = 43.0625$

Sign S	Exponent E	Significand F
0	1000 0100	0101 1000 1000 0000 0000 000

Special values

- IEEE formats can encode five kinds of values: **zero**, **normalised numbers**, **denormalised numbers**, **infinity** and **not-a-number (NaNs)**

- Single precision representations:

IEEE value	Sign field	Exponent	Significand	True exponent
± 0	0 or 1	0	0 (all zeros)	
$\pm$ denormalised no.	0 or 1	0	Any non-zero bit pattern	-126
$\pm$normalised no.	0 or 1	$1 \ldots 254$	Any bit pattern	$-126 \ldots 127$
$\pm\infty$	0 or 1	255	0 (all zeros)	
Not-a-number	0 or 1	255	Any non-zero bit pattern	

Denormalised numbers

- An **all zero exponent** is used to represent both **zero** and **denormalised numbers**
- An **all one exponent** is used to represent **infinities** and **not-a-numbers**
- Means **range for normalised numbers is reduced**, for single precision the exponent range is $-126 \ldots 127$ rather than $-127 \ldots 128$
- **Denormalised numbers** represent values between the underflow limits and zero, i.e. for single precision we have $\pm\, 0.F \times 2^{-126}$
- Allows a more **gradual shift to zero** – useful in some numerical applications

Infinities and NaNs

- Infinities represent values **exceeding the overflow limits** and for divisions of non-zero quantities by zero
- You can do basic 'arithmetic' with them, e.g.:

$$\infty + 5 = \infty, \qquad \infty + \infty = \infty$$

- NaNs represent the result of operations which have **no (real) mathematical interpretation**, e.g.

$\frac{0}{0}$, $+\infty + -\infty$, $0 \times \infty$, square root of a negative number

- Operations resulting in NaNs can either yield a NaN result (**quiet NaN**) or an exception (**signalling NaN**)

Special Operations

Operation	Result
N ÷ ± Infinity	0
± Infinity × ± Infinity	± Infinity
± non-zero ÷ 0	± Infinity
Infinity + Infinity	Infinity
± 0 ÷ ± 0	*NaN*
Infinity - Infinity	*NaN*
± Infinity ÷ ± Infinity	*NaN*
± Infinity × 0	*NaN*

☺ SOME FUN ☺

Floating Point Precision

- C code:

```c
#include <stdio.h>
int main() {

   float a, b, c;

   float EPSILON = 0.0000001;

   a = 1.345f;  b = 1.123f;

   c = a + b;

   if (c == 2.468)
      printf ("They are equal.\n");
   else
      printf ("\nThey are not equal! The value of c is %.10f or %f\n",c,c);

  // With some tolerance

  if (((2.468 - EPSILON) < c) && (c  < (2.468 + EPSILON)))
     printf ("\n%.10f is equal to 2.468 with tolerance\n\n", c);
}
```

Run-time

2. birnhorn.doc.ic.ac.uk (bkainz)

```
birnhorn:~> gcc imprecision.c
birnhorn:~> ./a.out

They are not equal! The value of c is 2.4679999352 or 2.468000

2.4679999352 is equal to 2.468 with tolerance

birnhorn:~>
```

Finding Machine Epsilon

- Pseudo-code

```
Set machineEps = 1.0;
Loop
    machineEps = machineEps/2.0
Until ((1 + machineEps/2.0) != 1)
Print machineEps
```

Finding Machine Epsilon

- C code

```c
#include <stdio.h>

int main( int argc, char **argv )
{
   float machEps = 1.0f;

   do {
      machEps /= 2.0f;
      // If next epsilon yields 1, then break, because current
      // epsilon is the machine epsilon.
   }
   while ((float)(1.0 + (machEps/2.0f)) != 1.0);

   printf( "\nCalculated Machine epsilon: %G\n\n", machEps );
   return 0;
}
```

Finding Machine Epsilon

- In Java

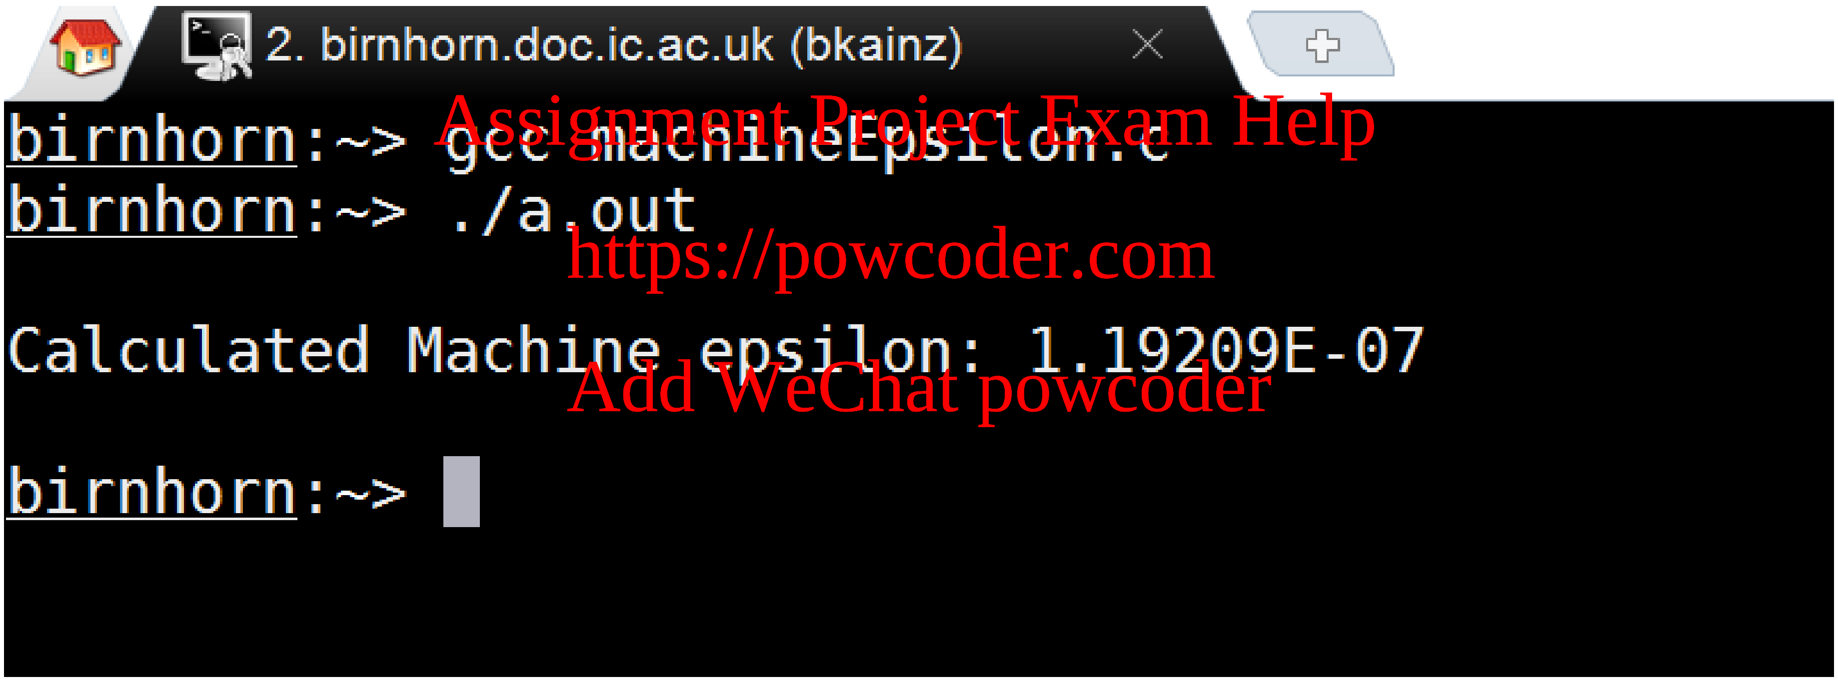
```
public class machEps
{
  private static void calculateMachineEpsilonFloat() {
        float machEps = 1.0f;

        do {
           machEps /= 2.0f;
        } while ((float)(1.0 + (machEps/2.0)) != 1.0);

        System.out.println( "Calculated machine epsilon: " + machEps );
  }

  public static void main (String args[])
  {
        calculateMachineEpsilonFloat ();
  }
}
```

Run-time



2. birnhorn.doc.ic.ac.uk (bkainz)
birnhorn:~> gcc machineEpsilon.c
birnhorn:~> ./a.out
Calculated Machine epsilon: 1.19209E-07
birnhorn:~>

Special Operations

- Example

```
#include <stdio.h>

int main (int argc, char **argv)
{
  float a = 1.0/0.0;

  float b = a * -100;

  float c = b/a;

  int d = 2 * 10 + 3;

  printf ("\nValue of a = %f\n\n", a);
  printf ("\nValue of b = %f\n\n", b);
  printf ("\nValue of c = %f\n\n", c);
  printf ("\nValue of d = %d\n\n", d);
}
```

Run-time

2. birnhorn.doc.ic.ac.uk (bkainz)

```
birnhorn:~> gcc specialOps.c
birnhorn:~> ./a.out

Value of a = inf

Value of b = -inf

Value of c = -nan

Value of d = 23

birnhorn:~>
